Problem 1.

1. We have this result from problem 2 in Problem Set 3:

$$l(\theta) = \sum_{i=1}^n \left(-\frac{1}{2} \log(\theta) - \frac{1}{2\theta} X_i^2 \right)$$

Taking deravite ans set to equal 0, we get:

$$\frac{\partial l(\theta)}{\partial \theta} = \sum_{i=1}^n \left(-\frac{1}{2\theta} + \frac{1}{2\theta^2} X_i^2 \right) = 0 \iff \theta^{MLE} = \frac{\sum_{i=1}^n X_i^2}{n} \quad (1)$$

2. From (1), we have the second deraviate of log-likelihood:

$$\frac{\partial^2 l(\theta)}{\partial \theta^2} = \sum_{i=1}^n \left(\frac{1}{2\theta^2} - \frac{1}{2\theta^3} X_i^2 \right) \iff I(\theta) = -\sum_{i=1}^n \mathbb{E} \left[\frac{1}{2\theta^2} - \frac{1}{2\theta^3} X_i^2 \right] = \frac{n}{2\theta^2}$$

Hence,

$$(\theta^{MLE} - \theta) \xrightarrow[n \rightarrow \infty]{(d)} N(0, \frac{2\theta^2}{n})$$

3.

a) From previous question, we know: $I(\theta) = \frac{n}{2\theta^2}$. Hence, $\pi(\theta) = c\sqrt{\det I(\theta)} = c\sqrt{\frac{n}{2\theta^2}}$. This is improper prior

b) We have

$$\pi(\theta|X_1, \dots, X_n) = \frac{\pi(\theta)p_n(X_1, \dots, X_n|\theta)}{\int_0^\infty p_n(X_1, \dots, X_n|t)d\pi(t)} = \frac{c\sqrt{\frac{n}{2\theta^2}} \frac{1}{(2\pi\theta)^{\frac{n}{2}}} e^{-\frac{1}{2\theta} \sum_{i=1}^n X_i^2}}{\int_0^\infty p_n(X_1, \dots, X_n|t)d\pi(t)} = \frac{c\sqrt{n}}{(2\pi\theta)^{\frac{n}{2}} \sqrt{2\theta^2}} e^{-\frac{1}{2\theta} \sum_{i=1}^n X_i^2}$$

Hence, we can rewrite the posterio:

$$\frac{c\sqrt{n}}{(2\pi\theta)^{\frac{n}{2}} \sqrt{2\theta^2}} e^{-\frac{1}{2\theta} \sum_{i=1}^n X_i^2} = \frac{c\sqrt{n}}{(2\pi)^{\frac{n}{2}} \sqrt{2}} \frac{e^{-\frac{\frac{1}{2} \sum_{i=1}^n X_i^2}{\theta}}}{\theta^{\frac{n}{2}+1}} = \frac{c\sqrt{n}}{(2\pi)^{\frac{n}{2}} \sqrt{2}} \frac{e^{-\frac{\beta}{\theta}}}{\theta^{\alpha+1}}$$

Where $\alpha = \frac{n}{2}$, $\beta = \frac{\sum_{i=1}^n X_i^2}{2}$ and c is the constant satisfied $\frac{c\sqrt{n}}{(2\pi)^{\frac{n}{2}} \sqrt{2}} = \frac{\beta^\alpha}{\Gamma(\alpha)}$. This posterior is Gamma distribution with parameters α and β .

We know $\theta(\hat{\pi}) = \int_0^\infty \theta d\pi(\theta|X_1, \dots, X_n)$ is the expectation of Gamma distribution with parameters α and β .

Hence, $\theta(\hat{\pi}) = \frac{\beta}{\alpha-1} = \frac{\sum_{i=1}^n X_i^2}{n-2}$.

Problem 2.

Problem 3.
